Feature

- Met DMX512 (1990)/RDM (2009) Protocol.
- 3 channels PWM output, the max current of each channel up to 5A
- With the light color selected mechanism, and be able to control the light with 1-3 colors
- DMX address can be set manually by button or RDM master if it works on RDM mode.
- DC power supply
- Support over current protection, short circuit protection function

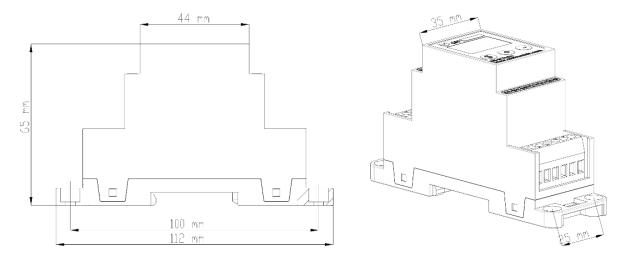

Technical Parameter

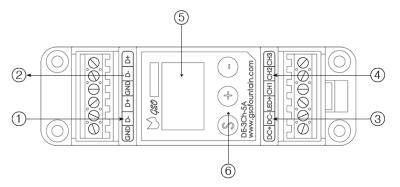

| Model | Data Reader |
|------------------|------------------------|
| Input Voltage | 12-24VDC |
| Input Signal | DMX/RDM Dimming signal |
| Output Current | 5A*3Ch (Max) |
| Output Power | 180W(12V)/360W(24V) |
| Output Channels | 3 |
| Dimming Output | PWM |
| Dimming Range | 0-100% |
| Installation | Rail or Screw fixing |
| Mounting Rail | TS-35/7.5 or TS-35/15 |
| Product Size | 112(L)*35(W)*67(H)mm |
| G.W | 90g |
| Work Temperature | -30 ~ 50°C |

Dimension

Interface Introduction

- (1)(2) DMX/RDM signal input/output interface
- (3) Power input interface
- (4) Driver output interface
- (5) Display LED
- (6) Keys for address setting

DMX/RDM signal interface

- 1. The DMX signal is not properly connected, current address and --- will be displayed on LED by loop and interval 2S;
- 2. The DMX signal is paused, current address and P will be displayed LED by loop and interval is 2S;
- 3. The DMX signal is normal, current address be displayed only;
- **❖** Power input interface:

DC 12-24V input, supply power for decoder and the lamps it takes.

Address setting keys:

Address can be saved automatically; address can be recovered when next power on

- ➤ When the address set for 0 to activate the RDM functions, at the same time the first DMX Address of device will be set by the RDM master.
- ➤ When the address is not 0, the device will be exit RDM function, then the device will be regarded as the conventional DMX decoder
- 1. Key "M", used to lock or unlock address setting function, normally address can't be setting. When long press this key for 3 seconds, the dot in the bottom right of LED will be on, used to indicate unlocked, you can change the address. After setting address, long

2 | Page

- press the M key 2S or do not press any button 5S, the dot will be off, indicating that the address code is locked and can't be modified
- 2. Key"+", used for add address number, short press add 1 each time, long press address will be changed very fast, reduce setting time, the maximum address is 511
- 3. Key"-", used for minus address number, short press address minus 1 each time, long press address will be changed very fast, reduce setting time, the minimum address is 0

Remark:

- The default address code is 1
- Address 508 to 511 is as a test mode to confirm that the wire is connected properly if there is no signal is coming.

Driver output interface

Common anode, V+ and R,G,B interface, can drive kinds of RGB module or single-color module, Can regulate output current according to the actual load.

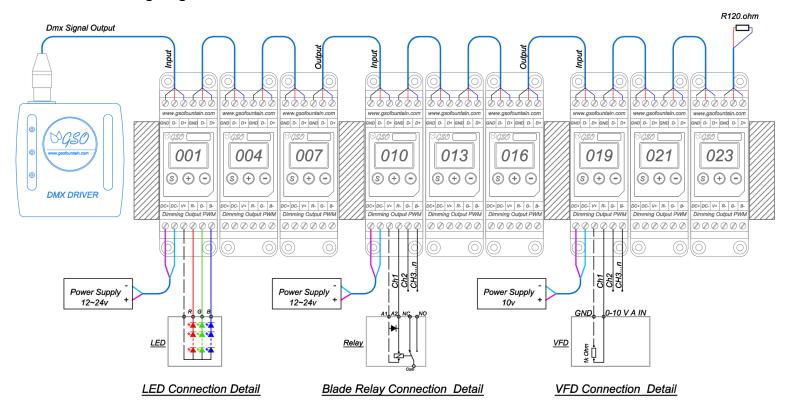

Remark:

Connect the anode and RGB wire of common anode RGB module to the output interface of decoder directly; Connect the anode wire of single-color module to V+ on decoder, and connect the cathode wire to one of RGB pin according to the LED's color;

Connect several colors single-color module to one decoder, please connect their anode wires to V+ pin on decoder.

Wiring Diagram

- The wire for DMX is STP, the DMX signal has positive and negative signal. Pay attention to the polarity while soldering. Connect the positive signal, negative signal and GND to the corresponding signal of device.
- Set DMX Address by button or be scan and set automatically by DMX master controller followed RDM protocol.
- Connect a signal terminal at the end of the whole connection.
